Document-as-code example

This is an example of a document created to illustrate the document-as-code principle. Instead of writing structured documents using a text processor or spreadsheet, the document is generated from a simple program written within a Markdown document. With the help of a generator program the Markdown document is transformed into another valid Markdown document. The domain model and the contents of the domain are written in Markdown and coffeescript. The generator replaces the coffeescript in the Markdown document with it's corresponding output.

Sources

This section lists the example sources for the requirements of the Document-as-code project.

identifier	title	version
S1	This is source 1	1.0
S2	This is source 2	1.1

Requirements

This section lists the example requirements applicable to the Document-as-code project. Each requirement refers back to the source it originates from and refers forward to the measures defined to implement or support the requirement.

identifier	description	sources
R1	This is requirement 1	S1
R2	This is requirement 2	S1, S2
R3	This is requirement 3	S2

Deliverables

This section contains the example deliverables that contain or implement the measures.

identifier	title
D1	Deliverable 1
D2	Deliverable 2
D3	Deliverable 3

Measures

This section contains the example measures defined to implement or support the requirements of the project.

identifier	description	requirements	deliverables	done
M1	This is measure one, it is marked as done	R1, R3	D1	true
M2	This measure has no deliverable defined	R1		false
